                                                                                                                                                                                                                             linker segments which were used in the creation of a fusion molecule of the coding sequences for Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are poth essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and
                                                                                                                                     Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C
                                                                                                                                                                                                                    present sequence is one of two oligonuclectides coding for NS4A and

The present sequence is one of two oligonuclectides coding for NS4A and linker segments which were used in the creation of a fusion molecule of the coding sequences for Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this
                                      Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Hepatitis; NS3 protease; viral replication; chronic liver disease;

                                                                                              The present sequence is the coding sequence for a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV unfection. This is useful as HCV can lead the present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be seed to identify inhibitors of this type, as well as enabling structural studies of the protease and
                            Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Hepatitis; NS3 protease; viral replication; chronic liver disease;
liver failure; liver cancer; mutant; muteln; ds.

fusion protein created using the Hepalitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antivirial treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. The protein produced from this
Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis {\sf C}

The sequences given in AA032472-82 and AA032442 are various clones which encode the NS2-NS4 regions of the Hepatitis C Virus (HCV) gene of the invention. These sequences were isolated from the serum of a patient suffering from hepatitis C (HC). The isolated RNA sequences were converted into cDNA using transcriptase in the presence of one of the primer sequences given in AA03253-164. The sequences were then amplified using primer pairs. The cDNA sequences isolated represent different alleles of the same region of the HCV gene. Sequence comparisons of these clones showed that it is possible for a AA032436.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acid construct encoding chimeric Hepatitis C Virus (HCV) pestivirus genome where the Npro protease gene is replaced with NS3 protease gene, useful for in vivo screening of compounds which inhibit
                                                   New hepatitis C virus gene and its encoded protein - used for diagnosing and vaccinating against hepatitis C virus infections

chimeric Repatitis C virus (HCV)-pestivirus genome. The construct comprises a pestivirus genome where a Npro pestivirus protease gene is replaced with a gene encoding a functional HCV NS3 protease. Furthermore, each junction site recognised by the Npro protease is replaced with a junction site recognised by the HCV NS3 protease. The construct is useful for screening compounds that inhibit HCV in vivo by inhibiting HCV protease, where screening may be in cell culture or in an animal model. The present sequence is a chimmeric clone of BVDV (bovine viral diarrhea virus)/HCV NS3-wt, which was used to illustrate the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4 serine protease domain, where the hydrophobic domain of native HCV NS4 septide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPase activity of NS3. The covalent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                HCV: hepatitis C virus; single chain recombinant complex; linker;

The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS3 protease domain. The covalent to the amino terminus of the HCV NS3 protease domain. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity and the ATPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available. The present sequence represents a primer used in the construction of the

The present invention describes a covalent hepatitis C virus (HCV) NS4A NS3 complex comprising a central hydrophobic domain of native HCV NS4A peptide, a linker, and an HCV NS3 serine profease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The covalent NS4A NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by MNR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPase activity of NS3. The covalent NS4A NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available. The HCV NS4A-NS3 complexes.
                                                                                                                                                                                                                                                                                                                    HCV; hepatitis C virus; single chain recombinant complex; linker; NS3 protease; NS4A cofactor; NS4A-NS3 complex; serine protease; hydrophobic domain; covalent complex; detection; inhibitor; primer; ss.
                                                                                                                                                                                                                                                                                           HCV NS4A-NS3 complex construction primer SEQ ID NO:42.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a covalent hepatitis C virus (HCV) NSAA-NS3 complex comprising a central hydrophobic domain of native HCV NSAA peptide. A linker, and an HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 periodese domain. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the halicase activity and the Arpase activity of NS3 complexes are more soluble, stable and active than the
                                                                                                                                                                                                                                                                        HCV; hepatitis C virus; single chain recombinant complex; linker;

Hepatitis C Virus

```
The present invention describes a covalent hepatitis C virus (HCV) NSAA NS3 complex comprising a central hydrophobic domain of native HCV NS4A peptide, a linker, and an HCV NS3 esrine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3A protease domain. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity and the APPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available. The present sequence represents a primer used in the construction of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Double stranded RNA; dsRNA; RNAI; RNA inhibition; cytostatic; virucide; proteozoadide; gene expression; antisense; tumour; infection; Plasmodium; virus; viroid; anti-GFP; human; HIV; human immunodeficiency virus; Hepatitis C virus; human papalloma virus; gene; ds.

The invention relates to inhibiting expression of a target gene in a cell by introducing at least two oligoribonucleotides (dsrNAI and II), both with a double-stranded (ds) structure of at most 49 sequential nucleotide pairs. At least part of one strand (sl., $2) of the ds structures in each of dsrNAI and II are complementary to regions in the target gene. The method uses antisense inhibition of gene expression using double stranded RNA inhibition (RNAI). The method is particularly used to treat tumours or infections, especially by plasmodium or viruses/viroids (pathogenic on humans, animals or plants). The method provides more effective inhibition of expression than known methods using a single dsRNA, even at very low concentrations. When dsRNA has at least one unpaired nucleotide at the end, stability (and thus effective concentration in the cells improved and efficiency can be increased further by pretreating the cells with interferon. The present sequence is that of a target DNA of the
                                                                                                                                                                                                                                                             Inhibiting expression of target genes, useful e.g. for treating tumors, by introducing into cells two double-stranded RNAs that are complementary to the target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 interferon; oncogene; cytokine; Id; developmental;

                                                                                                                                                                                                                          This invention describes a novel method for inhibiting expression of a target gene by introducing into the cell that contains the target gene at least one oligoribonuclectide (GRNAI) that has a double-stranded (GAS) structure of not more than 49 consecutive nucleotides (nt), where at least a segment of one strand of the ds structure is complementary with the target gene and the cells are treated with interferon before introduction of dsRNAI. The method is used to inhibit expression of target genes, particularly oncogenes, cytckine genes, Id (not defined) protein genes; developmental or prior genes expressed in pathogenic organisms (particularly plasmodia) or in viruses or virois (pathogenic in humans, animals or plants). Treating the cells with interferon greatly increases the extent to which dsRNA can inhibit expression of the target genes, and the effect is even greater when dsRNA are modified to increase their stability, ABX09936-ABX10075 represent

The invention relates to inhibiting expression of a target gene (1) in a cell by introducing an inhibitory RNA (dsRNA1) having a double-stranded structure of at most 49 consecutive bases. At least part of one strand (as1) of dsRNA1 is complementary to (1) and at least part of one strand has an overhang of 1-4 nucleotides. The method is used to inhibit the expression of a wide range of genes, e.g. oncogenes, cytokine genes etc. in humans, also genes in Plasamodium or in viruses or viroids that are pathogenic for humans, animals or plants. Introducing an overhang into dsRNA greatly increases effectiveness for inhibiting gene expression, both in vivo and in vitro and also increases stability and thus the effective concentration inside the cell. The present sequence is that of
                                                                                                                                                                                           the
                                                                                                                                                             expression of target gene, useful e.g. for inhibiting by administering double-stranded RNA complementary to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      161

Substance control of the sequence. BE556909
/note-"Vector: pT7T3D-Pac with a modified polylinker;
Site_1: EcoRI; Site_2: NotI; 1st strand cDNA was prepared
from zebrafish(C32) fin, and was then primed with a Not I
oligo(dT) primer. Double-stranded cDNA was ligated to
Eco RI adaptors (Pharmacia), digested with Not I and
cloned into the Not I and Eco RI sites of the modified
pT7T3 vector. Library is non-normalized. Library was
constructed by Ning Wu. NOTE: This clone is available
royalty-free through LLNL; contact the IMAGE Consortium
(info.inl.gov)for further information.

EST from a cDNA of a gene whose expression is spatially restricted during embrygonessis. We have esstablished its expression pattern during embrygonessis. We have esstablished its expression pattern on zebrafish embryos from the gastrula stage to 2 days of development. The corresponding data are available on the zebrafish community database at http://zfin.org/cDNA library preparation: B. Riggleman. DNA Sequencing by:IGBMC sequencing facility. Clone University of Oregon (Institute of Neuroscience, 1254 University of Oregon. Eugene. OR 97403-1254).
Seq primer: T3 ATTAACCCTCACTAAAGGGA.

Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library is non-normalized Library was constructed by Ning Wu. NOTE: This clone is available royalty-free through LLNL: contact the IMAGE Consortium (info.llnl.gov)for further information.
